

Set up rolls (FloorRight Commercial):

The FloorRight user can setup roll lengths while setting up a new material or set roll lengths after the rooms have been drawn.

In FloorRight 11.2 a feature was added Best Fit and In Order.

“Best fit” allows FloorRight to fit the pieces on the roll and the user manually sets the roll lengths. Best fit calculates material used and shows a lower waste percentage. This is the same way FloorRight has calculated rolls in the past.

“In Order” places the cuts in the order the user has moved them on the roll. In Order also allows the user to move cuts from one roll to another. In Order calculates waste based on how many rolls are used so In Order shows a higher waste. In the Job estimate screen if “In Order” is chosen the user can change the “Based On” from “Material Area” to “Roll Area”. The waste will be lower like the Best Fit option.

1. After the material has been setup click “Roll Options” at the bottom
2. Uncheck “Default roll length”
3. Type in the new roll length then click “OK”
4. After drawing rooms click “Layout” at the top of FloorRight and left click “View seams/stock layout”
5. Left click “Layout” again and left click “Set Roll Length”
6. Check “Best Fit” at the bottom if you need to manually enter roll lengths and begin to type in the length in each cell
7. Check “In order” so FloorRight will automatically assign how many rolls the material needs
8. Left click “Show Roll Allocation” on the bottom left
9. The user will see the rolls in the seam view
